Actinovate® AG

Biological fungicide for soil borne
and foliar diseases

Actinovate® AG is a powerful tool in disease control for strawberries, blueberries and other berry crops.

Actinovate® is an effective biological fungicide for use against soil borne diseases (when applied to the roots) and foliar diseases (when applied as a spray). As a soil treatment, Actinovate® AG colonizes the root system and prevents diseases from infecting the plant by producing several anti fungal compounds.

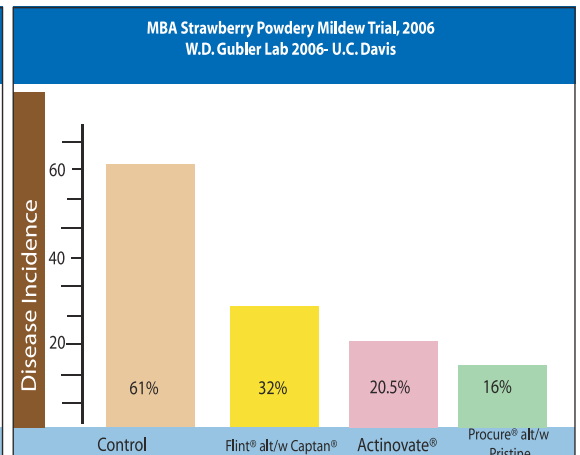

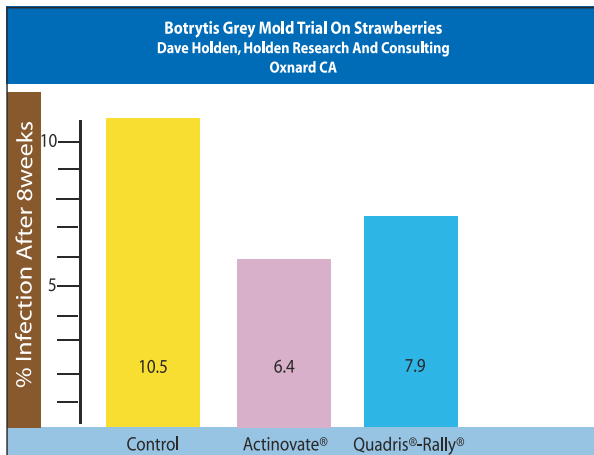

Root diseases controlled include *Pythium*, *Phytophthora*, *Fusarium*, *Rhizoctonia* and others. As a spray, Actinovate® works the same way except that it colonizes the foliage instead and prevents against foliar diseases such as *Botrytis*, powdery mildew and mummyberry (*Molinia*).
